ABSTRACT

A circuit board assembly includes a circuit board, an electronic component and a structure coupling the electronic component to the circuit board. The structure retains the electronic component relative to the circuit board at a selected one of a plurality of positions in both directions along an axis perpendicular to the circuit board. The structure is movably coupled to one of the electronic component and the circuit board in a direction perpendicular to the axis at least prior to being coupled to the other of the electronic component and the circuit board.
